

UNLEASH POTENTIAL

Consolidation of data sources for business insights

The challenge: Harnessing high quality data for accurate business insights

Your insights are only as good as the data behind them. Over the last few years, data has become the lifeblood of organisations. Those that harnessed the power of this data by empowering business users, found competitive advantage and were able to innovate faster.

Many organisations utilise multiple technologies and platforms to manage their structured and unstructured data. Business Intelligence (BI) often requires the merging of data from numerous sources. Faults within BI applications can occur if the data sources contain ungoverned and decentralised information. Manually captured data in spreadsheets from multiple data sources can lead to inaccuracies and reduced data integrity.

Decision Inc.'s Data Management team are dedicated to data governance through the quality management of data and business process systems. The team develop centralised and highly structured data warehouses that cleanse and organise data from multiple sources. By possessing a data-warehouse, BI tools function more intuitively and are able to analyse the refined data with increased speed and reliability as measures within the applications are met.

Centralised Data Warehouse

Key Benefits

Reliability: Robust solution with minimised human error

Speed: Data is easily consumed from the warehouse by any BI tool

Consistency: Accurate standardised data format across the organisation

Centralised data: Accessible across the business to aid in decision making
